

SWING GATE LAYOUT (Not all options include all of these protection loops)

An EXIT LOOP is embedded in the road close to the second Benedetti driveway and will automatically open the gate as a vehicle approaches from the inside. If our system is so equipped, the gate will auto-close 1-2 minutes after a vehicle exits the vicinity of the gate.

The REVERSING LOOPS trigger an immediate reversal of the gate if a vehicle enters their zone and holds the gate open as long as the vehicle remains in that zone.

The CENTER OR SHADOW LOOP simply prevents the gate from closing as long as a vehicle is detected in its zone.

This REVERSING LOOP functions as described above.
